Declaration of AI-Generated Material
Name: Pai Peng
Subject: CP3406
Assignment: 1 — Utility App

I declare that I used generative AI tools (Doubao) in the following ways during this assignment:

1. Learning Kotlin syntax: I asked AI questions to understand Kotlin language features (e.g., data classes, StateFlow, coroutines, Retrofit setup) that were new to me.
2. Debugging compilation errors: When I encountered build errors (e.g., missing annotations, dependency issues, XML placement), I used AI to explain the error messages and suggest how to fix them.
3. Understanding course concepts: I used AI as a study aid to explain Android architecture concepts (MVVM, Repository pattern, ViewModel) in simpler terms.

All code was written and pasted by me, and I understand and can explain every part of my code. The self-reflection and README were written by me in my own words. No code, README content, or reflection content was directly copied from AI output without my own understanding and modification.
